

Treatment Options

In my practice, I have used Kutapressin & now Nexavir, same product but the company changed the name, in the treatment of CFS with great success. Nexavir, sometimes in conjunction with other products like Immunoprop plus or has been very effective in treating CFS patients throughout the world. The specific dosage and length of treatment vary from patient to patient.

Nexavir injection is an amino acid complex, a liver derivative. It is an immune system adjuvant. Nexavir is thought to act on the immune system and reduce dysfunction. Nexavir (formerly named Kutapressin) has been in existence since the 1930's. It was originally used to treat skin diseases such as acne vulgaris, herpes zoster, "poison ivy" dermatitis, pityriasis rosea, seborrheic dermatitis, urticaria, eczema and severe sunburn. It has been used by numerous physicians since 1959 for various diseases due to its apparent anti-viral and anti-inflammatory properties and its long track record of being safe. Patients taking Nexavir rarely experience side effects and serious side effects are not known in given its 70 year history.

A lot of my colleagues in Europe, Australia and the US are using Nexavir as the main treatment for CFS/ME. To enhance its effectiveness, I have combined daily 2 cc Nexavir injection with other products such as
..... (It is combined with a food additive oral Immunoprop daily).

Nexavir works in Chronic Fatigue Syndrome (ME/CFS) because it has anti-inflammatory effects and it may inhibit two viruses HHV-6 and EBV that may be reactivated in some patients. It is sometimes also used as a broad spectrum anti-viral drug by certain doctors. Nexavir is an immunomodulator which also might explain some of its effectiveness when combined with other medicines and supplements.

While several studies have been done on Nexavir as a treatment for CFS in Houston, Brussels,....., my patients have experienced a very good success rate. Other doctors in Europe who specialize in CFS have reported to me similar results using Nexavir in combination with other vitamins.

CFS/ME patients have oxygen depleted or reduced in their cells and amazingly Nexavir replenishes the oxygen giving patients a lot of energy.

Dr Paul Cheney study shows that Nexavir closes the PFO hence it will avoid a lot of Heart surgeries. I personally has no experience with this, but i have a tremendous respect for Dr Cheney.

Nexavir is the only drug I know and my colleagues in Europe to cure XMRV and MLV (Maureen Leukaemia Virus). I have asked Nexco Pharma the company which produces Nexavir to make Nexavir in the form of gel (which is compounded right now), patch or sublingual.
